

PROCESS ARTIFACT

Current & Proposed Product Workflows

Medkart Savings Journey

CURRENT STATE	Reconstructed from two store visits and approximately five informal interactions
FUTURE STATE	Validation-ready hypothesis; not a description of Medkart's internal roadmap
PRIMARY ACTORS	Customer, store representative, retail system, app/CRM and support
VERSION	0.1 • 19 July 2026
STATUS	Workflow baseline for PRD drafting

Reading rule Solid teal steps are observed or proposed core flow. Amber steps are decisions or details that require verification. Red steps protect the customer when matching or data integrity fails.

1. Current-state workflow

The current-state workflow captures only what was observed or recalled. It does not attempt to reproduce Medkart's proprietary retail software or infer undocumented automation.

Current-state store purchase workflow

Reconstructed from limited store observations • not an internal system specification

Important: no major usability problem or feature request was identified by the two experienced representatives.

Figure 1. Reconstructed store purchase workflow. Amber steps require verification.

1.1 Step definitions

ID	Step	Actor	Definition	Evidence
C1	Customer request	Customer / representative	Customer asks for medicine; prescription rules were not studied	Observed generally
C2	Inventory lookup	Representative / retail system	Search item and locate its physical storage box	Observed
C3	Bill composition	Representative	Retrieve items and add them to the transaction	Observed
C4	Discount and membership	Representative / customer	Explain discount; identify membership using contact number; offer membership when applicable	Observed / recalled
C5	Bill completion	Representative / retail system	Confirm final transaction and produce bill	Observed generally

C6	Receipt	Representative / customer	Printed receipt confirmed; digital receipt requires verification	Partially confirmed
C7	CRM context	CRM / representative	Contact and expected medicine-completion timing visible; exact triggers and consent unknown	Requires verification

1.2 Current-state unknowns

- Exact membership duration, eligibility and discount rules.
- Whether and how a digital bill is delivered.
- How CRM medicine-completion timing is calculated and used.
- Where reminder consent is collected, stored, changed and withdrawn.
- How shared, recycled or incorrect phone numbers are handled.
- Refund, return, cancellation and partial-fulfilment flows.

2. Proposed-state workflow

The future-state workflow starts only after a pharmacist-verified store transaction. Its central design principle is fail-safe identity matching: an uncertain match must never expose a customer's purchase to another account.

Proposed store-to-app workflow

Hypothesis for validation • safe account matching and explicit consent are mandatory

Figure 2. Proposed store-to-app workflow with match, consent and exception paths.

2.1 Proposed step definitions

ID	Step	Owner	Requirement	Primary data
P1	Transaction complete	Retail system	Create eligible, pharmacist-verified transaction event	Transaction ID, store, items, totals
P2	Account match	Identity service	Match transaction to authenticated customer using approved identifiers	Match result and confidence/rule
P3	Eligibility check	Product rules	Exclude unsupported, sensitive, cancelled or otherwise ineligible records	Eligibility outcome and reason
P4	Publish record	App backend	Create customer-visible record only after P2 and P3 succeed	Purchase summary and invoice link

P5	Explain savings	App	Display auditable comparison source, assumptions and amount	Paid, comparator and savings
P6	Family assignment	Customer	Optional assignment to an authorized profile	Profile permission and audit event
P7	Reminder preference	Customer / CRM	Separate opt-in for purpose, channel and timing; reversible	Consent state and timestamp
P8	Customer action	Customer	View, reorder, locate store or contact support	Action event and outcome

3. Exception workflows

ID	Trigger	Safe system behaviour	Resolution
E1	No app account	Do not publish automatically	Invite account creation or verified claim without blocking store checkout
E2	Shared or recycled number	Treat match as ambiguous	Require additional verification; never reveal item details before verification
E3	Wrong purchase appears	Hide access and open urgent correction	Log incident, verify ownership, remove link and notify affected account appropriately
E4	Duplicate transaction	Suppress duplicate display	Use stable transaction ID and idempotent ingestion
E5	Refund / return / cancellation	Update record state	Preserve audit trail; recalculate totals and savings
E6	Savings comparator unavailable	Show paid amount without unsupported savings	Explain why comparison is unavailable
E7	Consent withdrawn	Stop future communication	Preserve lawful audit record; update all connected channels
E8	Family access removed	Remove profile visibility	Retain only access and audit data required by policy

4. Responsibility map

Actor	Responsible for	Not responsible for
Store representative	Complete accurate bill; explain membership; follow checkout SOP	Diagnose app, alter medical instructions or override identity rules
Retail system	Create authoritative transaction and status updates	Decide app visibility without eligibility and identity checks
App / identity	Match, publish, protect access and show status	Infer consumption, adherence or family ownership
CRM	Store explicit communication preferences	Treat transaction existence as reminder

	and enforce suppression	consent
Customer	Review record, assign authorized profile and control communication	Prove medical need to access their valid purchase record
Support	Resolve mismatches, duplicates and correction requests	Reveal data before identity verification

5. Workflow acceptance gates

- No store checkout dependency: app linking failure must not block a valid in-store sale.
- No uncertain exposure: ambiguous account matches produce no customer-visible item data.
- No bundled consent: purchase visibility, family assignment and reminder communication are separate decisions.
- No unsupported savings claim: comparison method and source must be explainable and auditable.
- No silent correction: refunds, returns, duplicates and ownership corrections update visible state and audit history.
- No clinical inference: the workflow does not provide diagnosis, dosage or adherence advice.

6. Open decisions before PRD approval

ID	Decision	Owner	Evidence
D1	Does linked in-store purchase history already exist?	Product / engineering	Capability review
D2	What identifier and verification rules permit safe matching?	Engineering / privacy	Architecture and threat review
D3	Which transactions or items are ineligible for automatic display?	Product / compliance	Policy definition
D4	How is savings calculated and what comparator is allowed?	Pricing / legal	Calculation standard
D5	What family-profile permissions apply?	Product / privacy	Access-control model
D6	What existing CRM consent can be reused, if any?	CRM / compliance	Consent inventory
D7	Who owns customer corrections and SLA?	Operations / support	Service blueprint
