

STANDARD OPERATING PROCEDURE

Linked Purchase Support SOP

Store and customer-support handling for the proposed Savings Journey MVP

STATUS	Draft for review and pilot simulation
APPLIES TO	Store representatives, customer support and area/operations managers
MVP	Linked purchase history, invoice, savings explanation and correction
VERSION	0.1 • 19 July 2026
OWNER	Proposed: Product Operations

Purpose Provide consistent, privacy-safe handling when a customer asks about a linked store purchase, invoice, savings amount or incorrect record.

Disclosure Proposed portfolio operating model based on the Medkart Savings Journey case study. This is not Medkart's current SOP, policy or service commitment.

1. Operating principles

- Store checkout is never delayed because app linking or support tools are unavailable.
- Verify the customer through an approved method before discussing transaction detail. A phone number alone is not proof of ownership.
- Reveal the minimum information necessary; never read out another account's purchase details.
- Do not interpret medicines, dosage or clinical suitability. Refer clinical questions to an authorized pharmacist/appropriate channel.
- Do not promise savings, correction or resolution timelines unless the approved policy provides one.
- When ownership is disputed, protect the record first and investigate second.

1.1 Roles

Role	Can do	Must not do
Store representative	Explain store bill, locate invoice route, create/route a support case.	Change app ownership, invent savings logic or expose other-customer data.
Customer support	Verify identity, inspect authorized case context, update safe status, coordinate correction.	Request unnecessary medical information or bypass authorization.
Product/Engineering support	Investigate event, match, invoice, lifecycle or calculation behavior.	Use unrestricted production data outside approved access.
Area/Operations manager	Confirm store process, escalation and staff readiness.	Resolve technical/privacy incidents informally without a record.
Security/Privacy owner	Lead suspected exposure or mis-linking response.	Delay containment while waiting for full root cause.

2. Standard customer-help flow

1	Listen and classify Ask what the customer is trying to do: find a purchase, open an invoice, understand savings, report incorrect details or report “not mine.” Do not ask for diagnosis, dosage or medicine history.
2	Confirm channel and authorization Use only the approved verification flow. If authorization is uncertain or the match is ambiguous, show/discuss no transaction detail and move to protected support.
3	Use the correct path Follow the scenario table below. Keep the retail billing source authoritative for transaction amount and lifecycle state.
4	Create a case when required Record case ID, transaction reference, category, safe description, timestamps and owner. Avoid customer contact details or medicine text in general notes unless policy requires and protects it.
5	Confirm the next step Give a case reference and safe status. Do not promise a date unless an approved SLA exists.
6	Close with evidence Record outcome, correction/reconciliation evidence and customer-safe closure reason. Link any product defect to the relevant QA case.

2.1 Scenario routing

Customer need	Immediate action	Escalate when
Purchase missing	Offer protected claim/help path; confirm no detail before verification.	No match, ambiguous match, repeated failure or suspected data issue.
Invoice unavailable	Keep checkout/bill context separate; retry approved invoice route or create case.	Service failure persists or wrong invoice appears.
Savings unclear	Open approved explanation; state unavailable if comparator is missing.	Displayed amount does not reconcile or method is unapproved.
Wrong amount/status	Create correction case; preserve original audit trail.	Return/refund event missing, amount inconsistent or repeated.

Customer need	Immediate action	Escalate when
Duplicate purchase	Create data-integrity case; do not double-count savings.	Duplicate survives refresh/reconciliation.
Not mine	Protect/hide record immediately; create privacy-priority case.	Always notify privacy/security owner under approved protocol.

3. Escalation and severity

Level	Example	Initial response	Owner
P0 — urgent	Another customer's record, authorization bypass, systemic mis-link.	Protect access, preserve logs, stop/disable affected path, incident escalation.	Security/Privacy + Engineering
P1 — high	Duplicate totals, incorrect savings, return not reconciled, unusable correction.	Create high-priority defect/case; assess pilot impact.	Product + Engineering
P2 — standard	Invoice retry, isolated UI/accessibility issue with workaround.	Create normal case and provide safe workaround.	Support/Product Ops
P3 — improvement	Copy, clarity or non-blocking usability feedback.	Record feedback for prioritization.	Product

3.1 Mandatory P0 actions

- Stop sharing or displaying the disputed record; do not ask the customer to reproduce exposure publicly.
- Capture only safe identifiers, time, channel and affected feature; preserve technical logs through approved access.
- Notify the named incident owners and pilot/release decision owner.
- Evaluate feature flag containment and whether other records may be affected.
- Do not close until protection, scope assessment, correction and communication decisions are recorded.

3.2 Handoff template

Field	Example (fictional)
Case ID	CASE-EXAMPLE-1042
Category	Not mine / incorrect link
Safe record reference	TXN-***-4281
Customer-visible state	Protected — under review
What happened	Customer reports the purchase is not theirs; detail was hidden immediately.
Action taken	Access protected; privacy owner notified; audit review requested.
Owner / next review	Assigned owner and approved review timestamp
Evidence	Authorized, redacted log/ticket links only

4. Data handling and closeout

4.1 Collect only what is necessary

Allowed when needed	Avoid in general notes/analytics
Case ID, safe transaction reference, issue category, timestamps, state and owner.	Full phone number, medicine names, prescription images, diagnosis, dosage or emotional/medical narrative.
Approved verification outcome, not secret verification answers.	Passwords, OTPs, payment credentials or unredacted identity documents.
Redacted technical evidence and event IDs.	Screenshots containing another customer's details.

4.2 Closure checklist

- Customer-visible status is accurate and safe.
- Record ownership/access is corrected or remains protected according to policy.
- Totals, lifecycle state and savings are reconciled where applicable.
- Root cause or product defect is linked, with regression scope.
- Customer receives an approved closure explanation and support route.
- Case retention and deletion follow approved policy.

5. Store briefing checklist

- Know where the customer can find Purchases, invoice, savings explanation and Report issue.
- Know that checkout continues during linking failure.
- Know that phone-number presence does not authorize disclosure.
- Know the “not mine” containment and escalation route.
- Know the approved non-clinical boundaries and pharmacist referral route.
- Have current support contacts and feature/pilot status.

Success measure The customer receives a clear next step, the record stays protected, checkout remains unaffected and every material issue has an owner and traceable evidence.
